**Abstract**—This study investigates the role of information theory in designing cryptographic protocols that establish trust in adversarial settings. By leveraging secure multi-party computations; the research aims to build an *open-source* software library demonstrating results.

## I. INTRODUCTION

If Scholarship funding for this study is approved by the *Chinese Ministry of Industry and Information Technology*, We will develop cryptographic frameworks with the promise of enhancing communication for cooperation in structured interactions. Implement information-secure and verifiable encryption protocols, aimed at securing game-theoretic coordination, and privacy-preserving decision-making.

## II. LITERATURE REVIEW

Cryptography extends far beyond Encryption, it serves as the foundation of digital trust. The tools at hand for this study are: *Zero-knowledge proofs*, *Homomorphic Computation*, *Garbled Circuits*, *Oblivious Transfer*, *Blockchains*, *Differential Privacy*, and *Threshold Cryptography*; —Combining these secure units enable broad collaborative problem-solving that are believed are the key to adversarial cooperation.

## III. RESEARCH QUESTIONS

- 1) What does it mean to apply cryptography to cooperation?
- 2) How can the proposed cryptographic protocols be improved through interdisciplinary collaboration?

## IV. RESEARCH OBJECTIVES

- 1) Demonstrate for classical game-theoretic problems.
- 2) Open-source a software library based on this research.

## V. METHODOLOGY

The study will focus on the following structured games:

- 1) *Playing card games without revealing one's cards*: —Demonstrate how to claim victory in a card game without exposing the cards at hand.
- 2) *Playing tic-tac-toe without revealing one's strategy*: —Demonstrate how a player can prove they have a winning strategy in tic-tac-toe without disclosing the actual moves.
- 3) *Classical adversarial stag-hunt*: —Demonstrate a path to equilibrium for this fundamental game of adversarial cooperation.

## VI. FUNDING REQUEST AND JUSTIFICATION

I humbly request the kind support of the esteemed members of the *Beihang University* in my application process.

Universities in Colombia currently lack research programs in this area. I have been diligently studying the Chinese language for several years, recognizing the importance of seamless communication and collaboration in a Chinese academic setting. I am deeply enthusiastic about the prospect of learning from and contributing to the vibrant research community in China. I believe this scholarship would not only enable me to pursue my professional aspirations but also foster valuable academic exchange between our nations.

## VII. TARGET UNIVERSITIES AND PROGRAMS

English-taught programs:

*Beihang University* Master's Cyberspace Security  
*Beihang University* Master's Integrated Circuit Engineering

## VIII. EXPECTED OUTCOMES

- 1) Demonstration adversarial cooperation in game-theory.
- 2) Development of an open-source cryptographic protocol suite enabling cooperation in adversarial settings.
- 3) Advocate on how cryptography facilitate trust in conflict.

## IX. CONCLUSION

This research seeks to show how cryptographic techniques can be used for peace-building and trust establishment.
